Batrachospermum "A"

Specimens collected in side stream of Pequonnock River, just below Factory Pond, Oct. 20 + 27, 1890, see dry mounts.

a little later on when I sought some for examination and preservation in Alcohol, it had disappeared.

Batrachospermum #1 (Ad. Sirodotii) R. Coerulescens, Sirodot.
abundant in Island Brook near its mouth at Berkshire pond.
First Collected in Dec. 1888.

Sept. 7 '89, Collected young plants on which W. A. Setchell pointed out trichogynes with pollinoids attached. — Collected frequently thereafter till March '90.

Setchell by his letter of Oct. 29 '89 says it is "to all intents & purposes" B. Coerulescens, Sirodot." See mounts & alcoholic specimens.

Found this species also in Ash Creek — in the mill race below Moody's Pond.

Batrachospermum #2

The remainder specimens dated XI-24-89 are what I originally mounted "2" — some of the same are in alcohol. Some of the later mounts, appear to be different.

All from the side stream of Pagwinnock River.

See No 4

Setchell says 8-7-'90 "No 2 + No A seem to be near B. Moniliforme var. Chlorosum, Sirdt,"

but No A seems to me to be quite a different thing.

Batrachosperm #3

Collected from the mouth of the little stream emptying into the east side of Baldwin Mill Pond

X1-24 & X11-8, 1889.

Soon after nearly disappeared there.

See #7

Alcoholic Specimens + Mounts

Batrachospermum #4

From Ash Creek, Mill race below Woods's Pond

X-17-XII-15 & XII-25 '89

Probably same as #2

Frederick Stanton
with E. M. Johnson

626 – Spirochaeta Dentium
In large expanded patches
on alveolus of lower jaw.
Patient paid visit for treatment
Could take it out in fairly clean
manner half an inch thick
Dark spirochaeta

627 Skin of face whitened

Saturday July 9 — 6 p.
with K. M. Johnson

628. Stizomia Miamiensis Ck.

629 = 621 ♀ form 2 mm. Flor.

630.* Spiroctenus nitida ♂ type
in fourth-instar full set

621. Post-larva

* Measurements not reckoned.
Cells 75—80 μ wide, 225—240 μ long
Spinules 5 or 6, mostly gradually ½—1 form
Resting cells about 75 μ long; female
cells not available for comparison with
Trogloraptor elliptical, generally
75 μ wide by about 100 μ long
always one or more visible cells
on one or both sides of a completely
filled

× Cells invisible

Sunday, July 10 - '92

632 "Pond Pool" Stratford

Spirogyra

In this pool grow what I provisionally take to be
a species of Microthamnion Kützingianum.
Cells generally about 17 or 18 μ in diameter
& length generally 3 - 6 diameters
Sometimes 2 or 8 rarely 1. Outer sheath is visible
at full depths. Dissepiments not visible under
Zygospores, all identical 56 - 57 μ long by 21 - 22 μ wide
Female cell usually plasmolysed to distance
Spiral
with dentations which appear to be 6 pointed
? whether this is not the case as in S. fluviatilis
Walls of the female cell which is next the male
cell — one side by a small bend may be a little thicker
Rather remarkable this is the season of zygospores

Thursday, July 14 - 9 a.m.
work at the Pond
at Stratford
